                                                                                      The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                             TCINGVCWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY 120

                                                                                                            The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NG4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins valued to identify inhibitors of this type, as well as enabling structural studies of the protease and

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NG4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NG3-NG4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                               0

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NG4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NG3-NG4A well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-7
                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

                                                                                                             The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HeV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HVV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HOV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both assential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease.inhibitor complexes. This sequence contains the alpha-helix() wild-type sequence.
                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                               The present sequence is a fusion protein created using the Hepatitis C virus (HCV) N33 and N84A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of MS3 mutents and MS3-MS4 fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                    Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MKKKGSVVIVGRINLSGDTAYAQQTRGEEGCQETSQTGRDKNQVEGEVQIVSTATQTFLA

                                                                                                                      The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex domain, where the hydrophobic domain of native HCV NS3 berine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 earlie protease domain. Where the hydrophobic domain of native HCV NS3 earlie protease domain. Where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NRR spectroscopy. They can also be used for detecting inhibitors by protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         62 CINGVCWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121

                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 earlie protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR specificacypy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

                                                                                                                                                                                                                                                                                        NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 berine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminal of the HCV NS3 protease domain. The present soquence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by MR specificacy, They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3 The covalent NS4A-NS3 complexes are more soluble, stable and active than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               81

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                 NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 berine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        CINGVCWTVYHGAGTRIIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121

The present invention describes a covalent hepatitis C virus (HCV) NS4A NS3 complex comprising a central hydrophobic domain of native HCV NS4A PST independent a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present complex: The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    62 CINGVCWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121

New hepatitis C virus covalent complexes
```

```
The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

oligonucleotide: the crystal structure provides insights into the mode
of unwinding:";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE-97331322; PubMed-9187654; Yao W., Hesson T., Cable M., Hong Z., Kwong A.D., Le H.V., Weber P.C.; "Structure of the hepatitis C virus RNA helicase domain."; Nat. Struct. Biol. 4:465-467(1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ACTIVATION OF NGS.

-!- FUNCTION: NS54 SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-!- FUNCTION: NS54 IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICANTON.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-!- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Structure 6:89-100(1998).

YARY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1027-1210 AND 1678-1691.

YAR Y., Li Y., Munshi S., Sardana V., Cole J.L., Sardana M., Steinkuehler C., Tomei L., de Francesco R., Kuo L.C., Chen Z.;
Steinkuehler C., Tomei L., de Francesco R., Kuo L.C., Chen Z.;
T. Complex of N3 protease and NS4A peptide of BK strain hepatitis C.
T. VILUS: a 2.2 A resolution structure in a hexagonal crystal form.";
Protein Sci. 7:837-847 (1998).

- I- FUNCATION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 NAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 NAY PLAY A ROLE IN THE STACH bonds in the viral presursor polyprotein, commonly with Asp or Glu in the P6
presursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl'.

C. CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +

"I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-:-CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral position, Cys or Thr in Pl and Ser or Ala in Pl'.
-:-CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3 4.22.-); Protease/helicase NS3 (P70) (Hepacivitin)
(EC 3 4.21.98); Nonstructural protein NS5A (P65); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P65) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J6) (HCV).
Viruses; ssRNA positive-strand viruses, no DNA stage; Flavivridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               {RNA}(N).
LIPOPROTEIN THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NSAA (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NSAA (P4); Nonstructural protein
NS5B (P66) (P70) (RMa-directed RNA polymerase) (EC 2.7.7.48)).
Hepatitis C virus (isolate HG-J8) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                           VITOLOGY 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in P1 and Ser or Ala in P1'.

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                MEDLINE-92230232; PubMed-1314459;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "The chloroplast lumen from Arabidopsis thaliana."; .
Submitted (JuL-201) to the SWISS-PROT date bank.
-1. SUBCELLULAR LOCATION: Chloroplast: within the thylakoid lumen.
-1. SIMILARITY: BELONGS TO PEPTIDASE FAMILY S2C.
-1. CAUTION: Ref. 2 sequences differ from that shown due to erroneous gene model prediction. AT4G18370 and AT4G18375 were originally fused into a single gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE OF 72-82; 96-110; 150-159; 178-211 AND 306-320. BYEKLOMENTAL STAGE: DFTECTABLE IN THE EPIBLAST OF OCCYTES AND THROUGHOUT EARLY MOUSE EMBRYO DEVELOPHENT. IN ADULT, EXPRESSION LOCALIZED IN GONADAL GERM CELLS.

SIMILARITY: Contains 2 protein tyrosine phosphatase domains.

SIMILARITY: Contains 10 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 - protein

Hepatitis C virus.
Viruses: ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
Hepacivirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   J. Geo. Virol. 82:1291-1297(2001).

-1- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).
